

Senior Swing™ Alternate Action Functionality takes it beyond ADA control

For flexibility and convenience beyond what you'd expect from a typical ADA operator, it's Senior Swing. The Senior Swing operator utilizes microprocessor controls with various switches and function settings that can be activated after installation to accommodate site-specific traffic movement.

Alternate Action is a unique function that turns doorways into hold-open "hands free" entrance-ways. When Alternate Action is selected, the door opens upon an activation signal from a push plate or button, and remains open until the door receives another signal. This function is particularly useful to accommodate forklifts and material handling in factories and warehouses. In office buildings, Alternate Action allows one to open and close the door from the convenience of their desk. This is especially useful if noise in the hallway becomes disruptive. Senior Swing provides ADA compliance in tandem with automated convenience!
